

Solar carried the middle of the day; gas carried the evening, and the price followed it

Average hourly generation and day-ahead price during the 28 July – 12 August 2026 heatwave

— Demand Fossil Net import Storage Solar Other renewables Nuclear — Day-ahead price

France

peak 47.4 GWh · 8 heatwave days

Greece

peak 8.3 GWh · 16 heatwave days

Hungary

peak 6.0 GWh · 14 heatwave days

Romania

peak 7.1 GWh · 13 heatwave days

Fossil is drawn at the top of the stack because it is the marginal unit: dispatched last, and the one that sets the price. The price panel is the same hours and the same days.

Hours are local, so Greece and Romania (EEST) line up with France and Hungary (CEST). Each panel has its own scale · France peaks near 47 GWh, Greece near 8.

Generation stacks above zero and net exports fall below it, which is why France, an exporter throughout, carries a band beneath the axis.

Storage is discharge only: ENTSO-E publishes pumping separately, and Hungary and Romania report no pumped storage at all. Demand and generation do not close exactly · distributed solar counts as generation but never crosses the transmission load meter, and Greece also trades with Albania, North Macedonia and Turkey, outside ENTSO-E's data.
