Wind and hydro gave way; gas, solar and the interconnectors took over

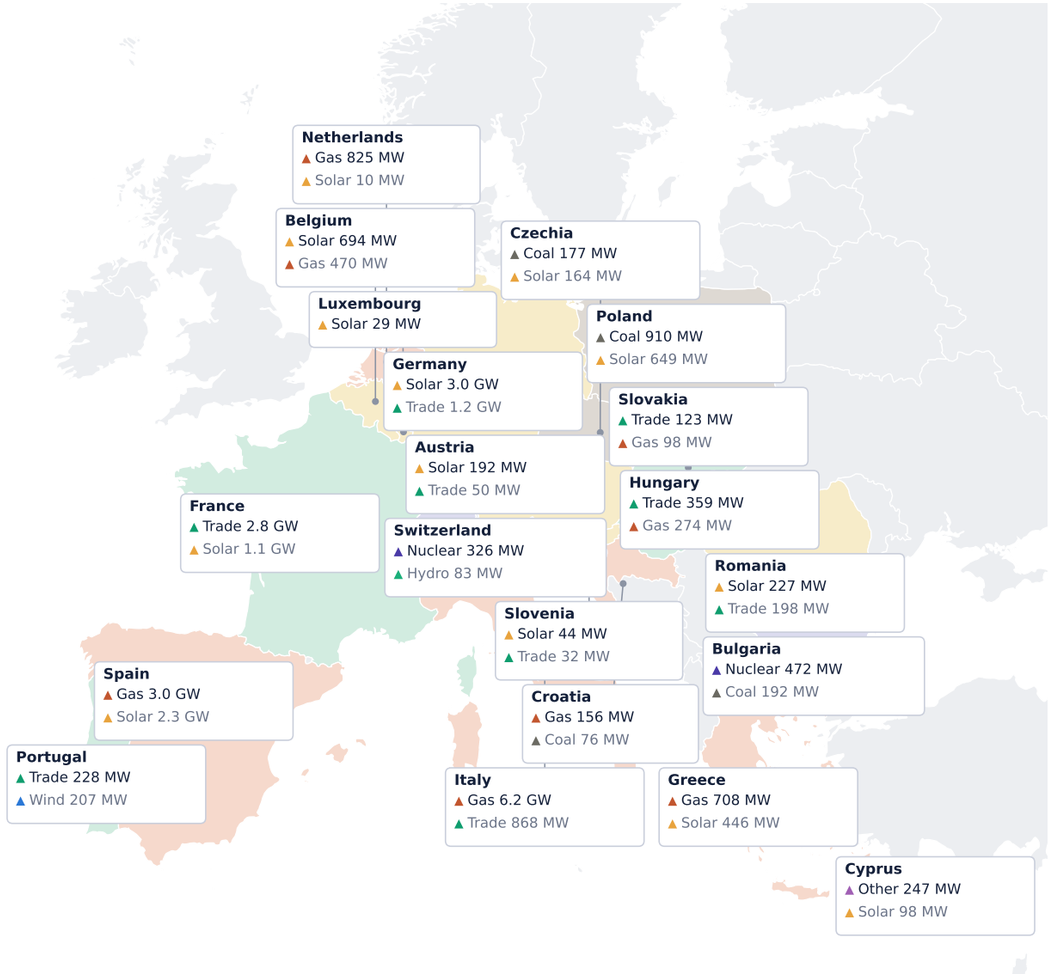

The two components that moved most in each country on its 2026 heatwave days, against all non-heatwave days of the same season and day type

Wind Hydro Nuclear Coal Other Solar Gas Net trade

What fell the most

What rose to replace it

Figures are power, in gigawatts or megawatts, not percentages: the trade component crosses zero, so Bulgaria's net imports falling 4.9 GWh/day on a negative base would compute as +36%. Ranking is within each country, so Germany's 4.1 GW of lost wind and Slovenia's 95 MW of lost hydro are each their own country's largest move.

Heatwave days: 3 or more consecutive days above the local 90th-percentile daily maximum (2014–2025 baseline), or above 30 °C · Source: ENTSO-E Transparency Platform · ERA5 via Open-Meteo
