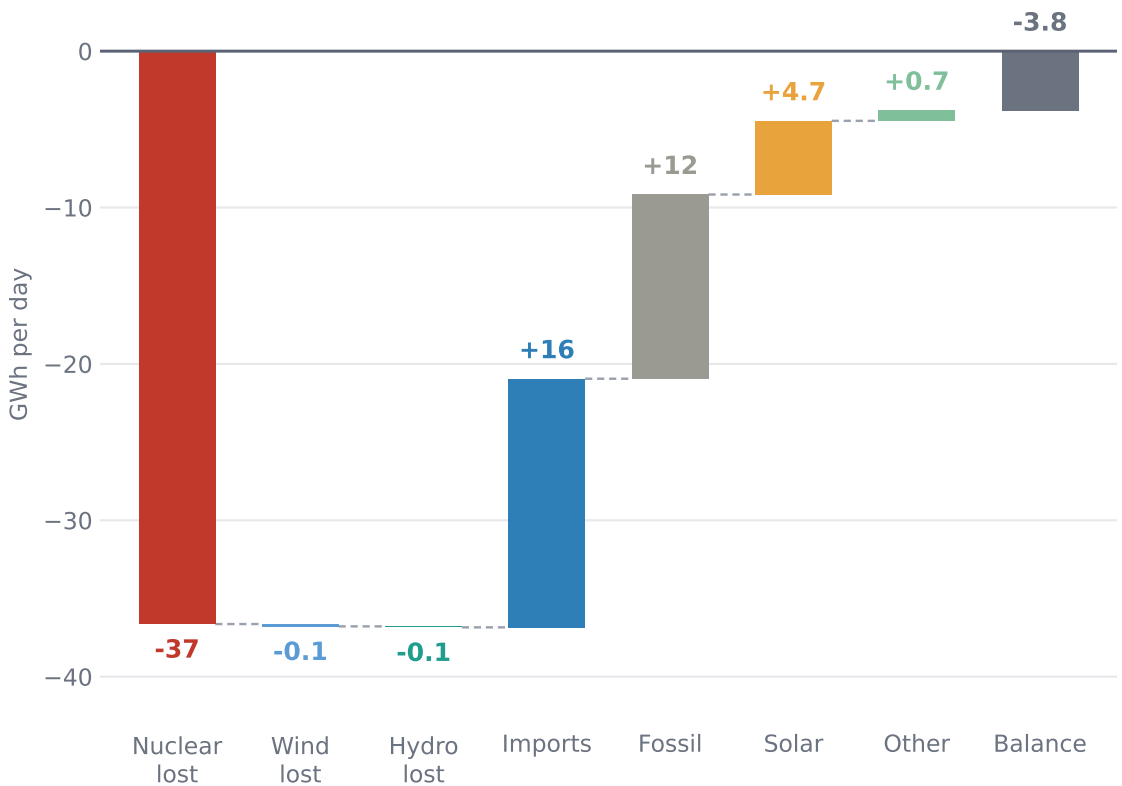
# Hungary bought its way through the outage; Romania burned through it

Everything that fell, then everything that rose to cover it, in gigawatt-hours per day. Each country is measured against its own pre-outage plateau.

## Hungary

37 of 111 GWh/day demand

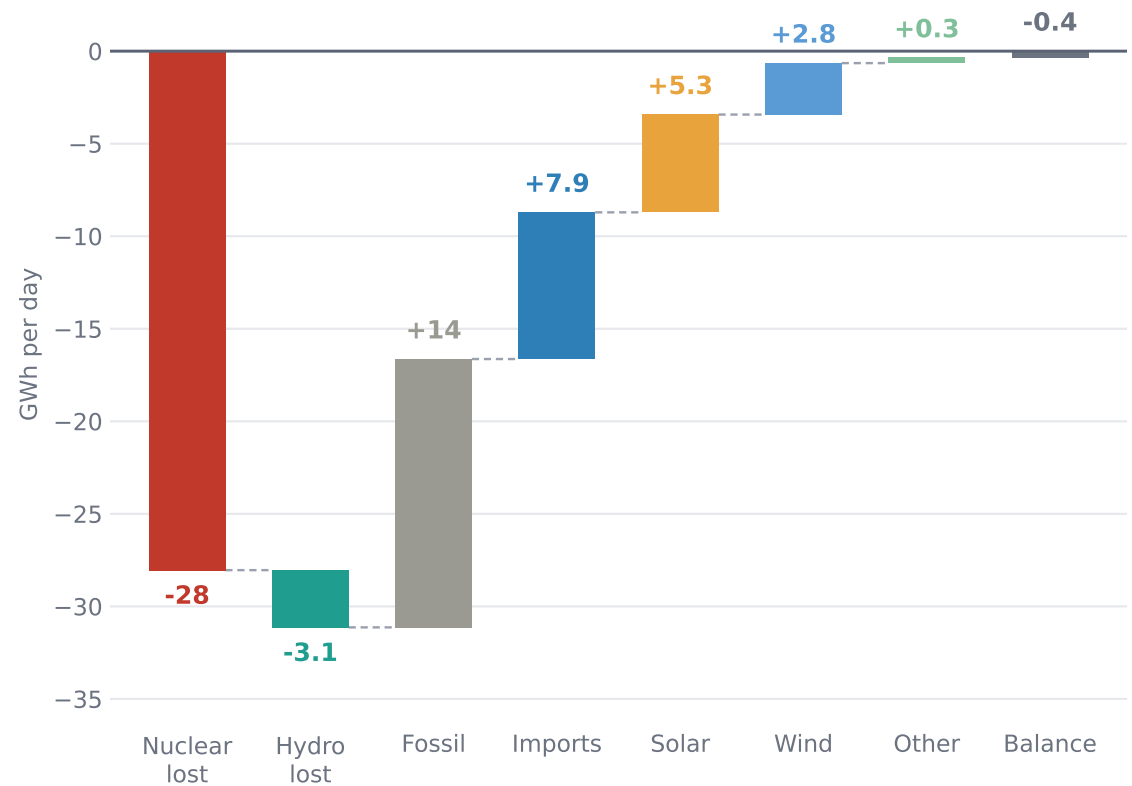
**33% of the system**



## Romania

31 of 137 GWh/day demand

**23% of the system**



Hungary lost 37 GWh/day and covered 28 of it with imports and fossil generation, against 4.7 from solar.

Romania lost hydro as well as nuclear · 3.1 GWh/day of a 31 GWh/day shortfall · and refilled it mostly with fossil (14.5), solar and wind adding 8.1.

Periods are taken from the daily series, not assumed. Hungary: 5–27 July against 2–20 August. Romania: 7–27 July against 14–20 August, the days its output read zero.

The bar above each panel puts the loss against total demand, so its size reads against the system it sits in: 33% of Hungary's daily demand and 23% of Romania's.

Solar and wind cannot respond to a reactor going offline; they moved for their own reasons. In the same July-to-August window of 2025, with no outage, Hungarian solar FELL 1.6 GWh/day.

The dispatchable answer was fossil and imports: 28 of Hungary's 37 GWh/day and 22 of Romania's 31. The closing bar is what the sources add up to, not forced to zero.
