

Hungary bought its way through the outage; Romania burned through it

Everything that fell, then everything that rose to cover it, as shares of each country's total generation loss. Measured against its own pre-outage plateau.

Hungary covered 84% of its shortfall with imports and fossil generation and only 14% with solar.

Romania lost hydro as well as nuclear · 10% of its total shortfall · and refilled it mostly with fossil (47%), solar and wind adding 26%.

Periods are taken from the daily series, not assumed. Hungary: 5-27 July against 2-20 August. Romania: 7-27 July against 14-20 August, the days its output read zero.

Bars to the left of zero are everything that fell, bars to the right everything that rose. Each side is shown as a share of that country's total generation loss: 37 GWh/day in Hungary, 31 in Romania.

The closing bar is generation and trade rather than metered demand. The measured gains come to 90% of Hungary's losses and 99% of Romania's before being scaled to close;

the shortfall is a metering artefact, not a missing fuel · distributed solar counts as generation but never crosses the transmission load meter, and small units sit below ENTSO-E's threshold.
