

Hungary bought its way through the outage; Romania burned through it

What replaced the lost nuclear output, as a share of the reduction. Each country is measured against its own pre-outage plateau.

Hungary covered 76% of its shortfall with imports and fossil generation and only 13% with solar.

Romania leaned hardest on fossil (52%), with solar and wind together adding 29% and hydro falling a further 11%.

Periods are taken from the daily series, not assumed. Hungary: 5-27 July against 2-20 August. Romania: 7-27 July against 14-20 August, the days its output read zero.

Bars are shares of each country's own nuclear reduction, so the two panels are comparable despite Hungary losing 37 GWh/day and Romania 28.

Demand did not stand still: it rose 2.7 GWh/day in Hungary and 4.6 in Romania over the same period, which widens the hole the other sources had to fill.

The last bar is what the measured components do not account for · distributed solar counts as generation but never crosses the transmission meter, and small units fall below ENTSO-E's threshold.
