

Solar carried the middle of the day, but gas and imports carried the evening peak

Average hourly demand and generation by source during the 28 July – 12 August 2026 heatwave (GWh)

— Demand Net import Storage Solar Other renewables Fossil Nuclear

Italy

peak 44.5 GWh · 16 heatwave days

France

peak 47.4 GWh · 8 heatwave days

Greece

peak 8.3 GWh · 16 heatwave days

Hungary

peak 6.0 GWh · 14 heatwave days

Romania

peak 7.1 GWh · 13 heatwave days

How to read

Generation stacks above zero, net exports below it. The dark line is demand.

Hours are local (EEST in Greece and Romania, CEST elsewhere).

Panels have independent scales.

Heatwave days: 3 or more consecutive days above the local 90th-percentile daily maximum (2014–2025 baseline), or above 30 °C, using each country's own days.

Storage is discharge only (ENTSO-E publishes pumping separately), so the band never dips below zero; Hungary and Romania report no pumped storage.

Demand and generation do not close exactly: distributed solar counts as generation but never crosses the load meter; Greece also trades outside ENTSO-E.
