

Hungary bought its way through the outage; Romania burned through it

Everything that fell, then everything that rose to cover it, in gigawatt-hours per day. Each country is measured against its own pre-outage plateau.

Hungary lost 37 GWh/day and covered 28 of it with imports and fossil generation, against 4.7 from solar.

Romania lost hydro as well as nuclear · 3.1 GWh/day of a 31 GWh/day shortfall · and refilled it mostly with fossil (14.5), solar and wind adding 8.1.

Periods are taken from the daily series, not assumed. Hungary: 5–27 July against 2–20 August. Romania: 7–27 July against 14–20 August, the days its output read zero.

The first bar is total demand, on the same axis, so the hole reads against the system it sits in: 33% of Hungary's daily demand and 23% of Romania's.

Solar and wind cannot respond to a reactor going offline; they moved for their own reasons. In the same July-to-August window of 2025, with no outage, Hungarian solar FELL 1.6 GWh/day.

The dispatchable answer was fossil and imports: 28 of Hungary's 37 GWh/day and 22 of Romania's 31. The closing bar is what the sources add up to, not forced to zero.
