

# Since February, France has run above its five-year range every month and Romania below it every month

Nuclear generation by month (TWh)

— 2026    - - Five-year average (2021-2025)    Five-year monthly range

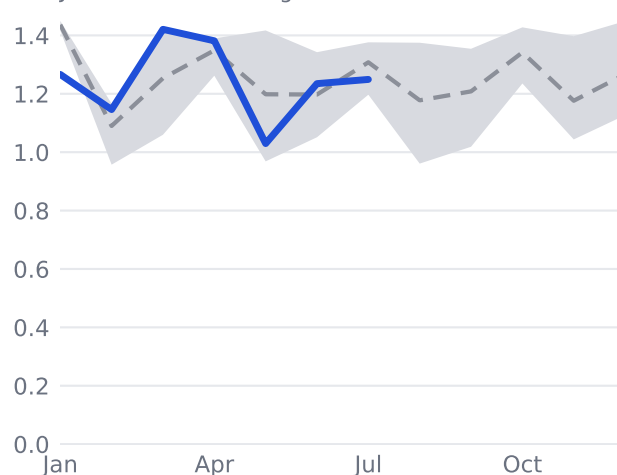

## France

Jul: 15% above average

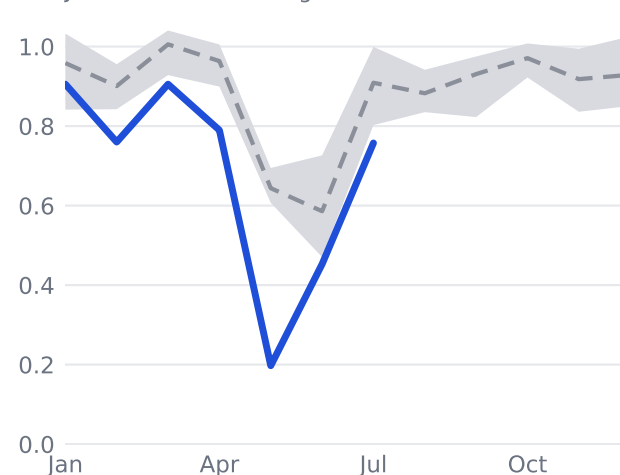

## Hungary

Jul: 4% below average

## Romania

Jul: 17% below average

Each panel has its own scale: France runs about 30 TWh a month against roughly 1 TWh in Hungary and Romania, so a shared axis would flatten the smaller two. Shaded band is the monthly minimum to maximum across 2021-2025. Months with fewer than 25 days of reported data are excluded, which drops the month in progress and the start of the record in April 2021. January to March rest on four years rather than five.
