

Hungary and Romania lost most of their nuclear output in early August, while France ran near the top of its five-year range

Daily nuclear generation, 1 July – 15 August (GWh per day)

— 2026 - - Five-year average (2021–2025) ■ Five-year daily range

France

919 GWh/day, 11% above the five-year mean

Hungary

29 GWh/day, 29% below the five-year mean

Romania

20 GWh/day, 33% below the five-year mean

The Romanian and Hungarian troughs are reported output, not gaps: both countries filed a full day of readings throughout, and Romania's were zero from 14 August.

Each panel has its own scale: France runs about 900 GWh a day against roughly 30 in Hungary and Romania, so a shared axis would flatten the smaller two.

Shaded band is the daily minimum to maximum across the same calendar days in 2021–2025; days with fewer than 18 readings are excluded. France's band spans the 2022 corrosion outages at its floor and 2025 at its ceiling, so it is wide by construction.
