Five times the renewable share, and barely any difference in price

Average day-ahead price and renewable share of generation on heatwave days, May–September 2026. Renewable share runs from 16% to 84% across these ten countries. The price stays inside a €21/MWh band.

Renewable share of generation

- under 25%
- 25-39%
- 40-54%
- 55-69%
- 70% and over

What the heat added

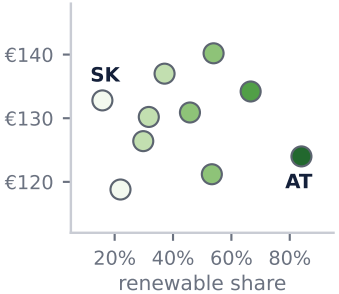

Day-ahead price on heatwave days against matched normal days

Every one of the ten rose. The gap between the biggest and smallest rise is €18/MWh.

Plotted against each other

r = +0.03 · no relationship

Correlation between renewable share and price across the ten: r = +0.03. A heatwave day is 3+ consecutive days above the local day-of-year 90th percentile of daily maximum temperature, or at or above 30 ·C; each country is measured against its own non-heatwave days in the same May–September season, weekdays matched to weekdays. Price is the unweighted daily mean of day-ahead prices. Source: ENTSO-E Transparency Platform; ERA5 via Open-Meteo.
