

Hungary bought its way through the outage; Romania burned through it

Everything that fell, then everything that rose to cover it, in gigawatt-hours per day. Each country is measured against its own pre-outage plateau.

Hungary lost 37 GWh/day and covered 28 of it with imports and fossil generation, against 4.7 from solar.

Romania lost hydro as well as nuclear · 3.1 GWh/day of a 31 GWh/day shortfall · and refilled it mostly with fossil (14.5), solar and wind adding 8.1.

Periods are taken from the daily series, not assumed. Hungary: 5-27 July against 2-20 August. Romania: 7-27 July against 14-20 August, the days its output read zero.

Bars to the left of zero are everything that fell, to the right everything that rose, in gigawatt-hours per day. The scale is absolute so the hole reads against the whole system:

Hungary's 37 GWh/day is 34% of its daily demand, Romania's 31 is 23%.

The closing bar is what the sources add up to, not forced to zero. Romania lands within 0.4 GWh/day; Hungary is 3.8 short because distributed solar counts as generation but never crosses the transmission load meter.
